USB 2.0 Type-A to Micro-B electroluminescent cable

It´s flowing light - and it turns blue!

Of course it is technically more complicated to produce an electroluminescent cable than it seems at first. But most importantly, the IB-CB023EL looks nice when turned off, but even prettier when turned on. It's not easy to find an electroluminescent cable, but to like it all the more - that's a promise!

EL = Electroluminescence

The solid material inside the cable is made to illuminate by applying an electric field. This results in a flowing spiral light pulse which makes the data transfer or charging process of your USB Type-A devices astonishing – without the loss of energy.

Visually enhances any environment

The tangle of cables on your desk or the boring charging cable in your car can quickly make everyday life dreary. With the IB-CB023EL, some movement and light comes into play - and everyday life is a little more exciting!
